

Saturn Network – Decentralized Exchange DAO for all EVM blockchains

www.saturn.network

Reshaping the future of cryptocurrency trading to a model that is secure, fair and equal for all users.

The problem?

Cryptocurrency trading has thrown away its decentralized roots and followed the traditional route of centralized financial institutions for building exchanges. As a result at higher levels, it is plagued with all the same problems like insider trading and market manipulation. And at lower levels, we read daily stories about traders being locked out of their accounts and no longer having access to their funds. Furthermore, due to centralized exchanges architecture they are at risk of being hacked - something which routinely happens. Just like in the world of high street trading there is now a complete imbalance of power, where the everyday user is the victim.

The hurdle?

Decentralized exchanges cannot be rigged or hacked yet remain difficult for even experienced traders to use. They have unfriendly interfaces and as a result, suffer from lower trading volumes. Due to their lack of liquidity, they cannot attract new traders or investors and remain a niche market. Then you have to factor in that currently there is no solution for truly decentralized cross chain trading, which leaves investors with the impression there is little room for growth.

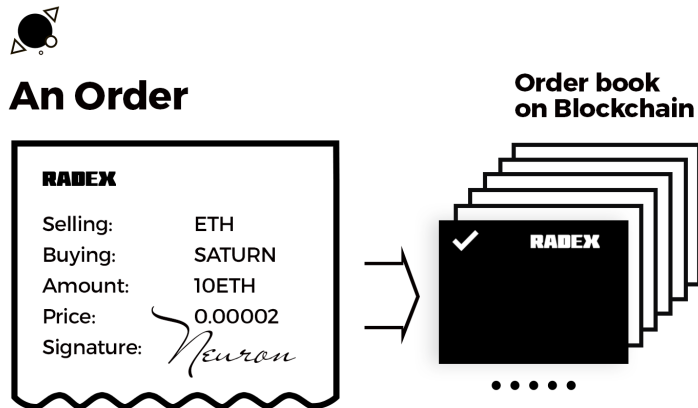

The solution?

Saturn Network is a protocol that allows access to a decentralized order book in just one transaction. Allowing decentralized exchanges to share a liquidity pool and feel the benefits of a much higher trading volume. It requires no deposits and runs completely on the Ethereum blockchain, making it always accessible to everyone. Furthermore, it has been built with shared ownership in mind to ensure there are no imbalances of power: holding SATURN tokens means you are part of the Saturn DAO. You will be able to vote on binding protocol changes or even be paid dividends from exchange fees. Finally, our protocol can run on any EVM blockchains, with Ethereum Classic and Callisto already on our roadmap, we will achieve decentralized cross chain trading.

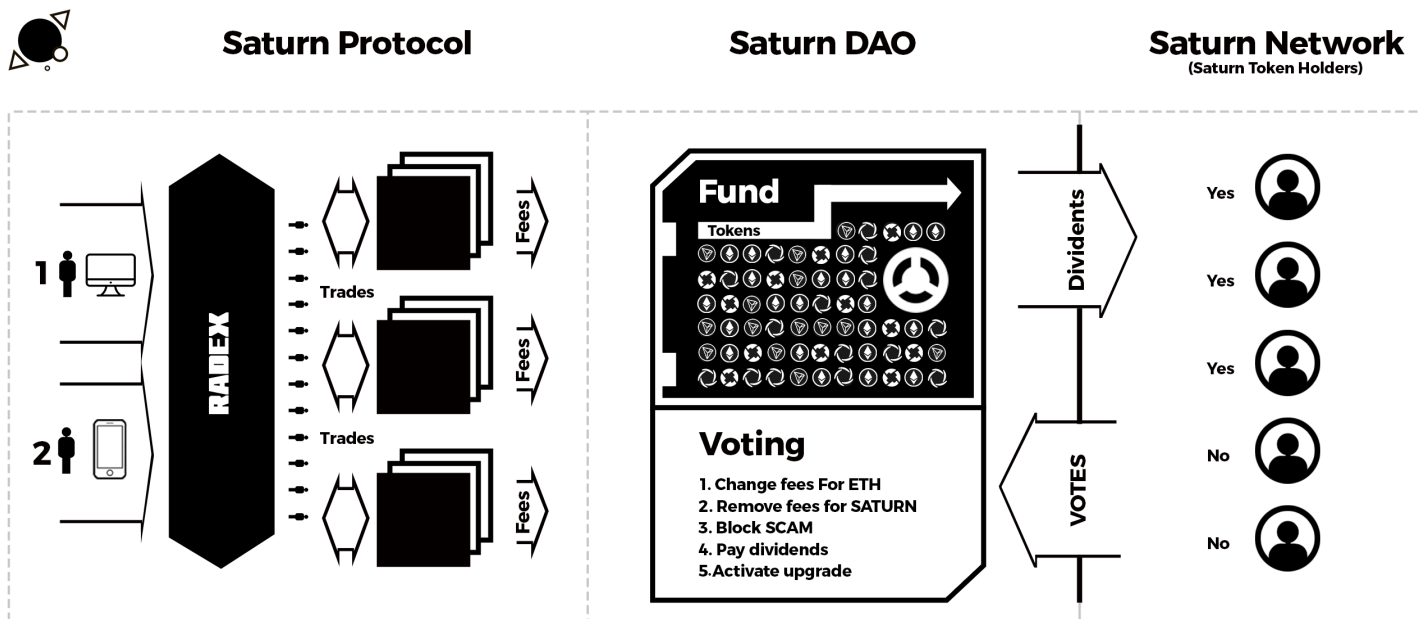

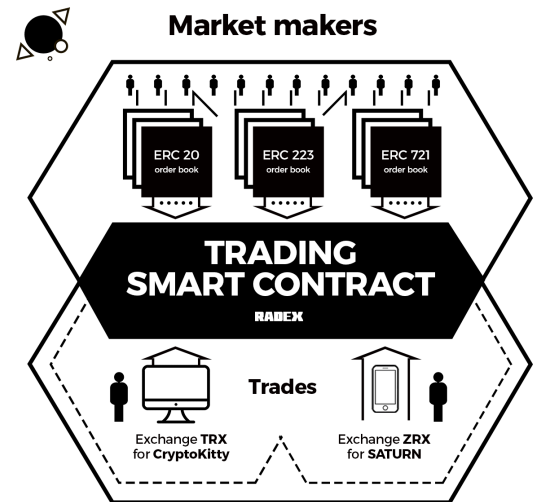

How does the Saturn Protocol work?

The Saturn Protocol is our unique architecture on how decentralized trading should work, one that we are already showing is possible with our proof of concept Radex. First, let's start with orders:

Market makers create orders on multiple order books: for ERC20, ERC223, ERC721, and any other token standard that may emerge in the future. Traders can take these orders and exchange any combination of tokens, even across standards (i.e. exchange ERC20 token for ERC721 collectible like a Cryptokitty)

Saturn DAO receives the fees from trading and pays them to token holders as dividends. Saturn Token holders vote on protocol changes and smart contracts enforce these vote results. Blockchain-backed voting controls Saturn Protocol fees and future development.

Saturn Network – Decentralized Exchange DAO for all EVM blockchains

www.saturn.network

Reshaping the future of cryptocurrency trading to a model that is secure, fair and equal for all users.

We will release Saturn Protocol on multiple blockchains, for decentralized trading of tokens within any given blockchain. Our mission is to bring decentralized exchanges to every blockchain. Cross blockchain trading will be facilitated via Atomic Swaps in the future.

ICO Details

No minimum investment, whitelist or KYC. The Saturn Network is open and accessible to anyone who wishes to participate. All investment will be taken via smart contract and be ensured directly by the Ethereum blockchain.

Price:	1 ETH = 50,000 SATURN
Start date:	01/05/2018
End date:	31/07/2018
Soft Cap:	1,675 ETH Full details
Hard Cap:	10,000 ETH

Strategic Investor Program

We also have several bonus plans available, for participants who believe like us the future of cryptocurrency trading is decentralized. This program is currently [live](#) and has a different token allocation than our ICO.

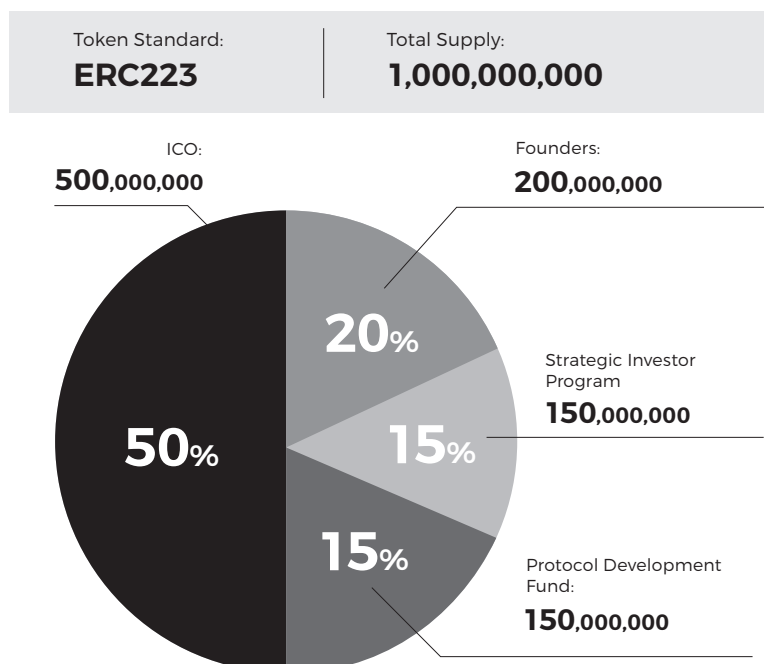

1. A 10% bonus with a 12 weeks lock-up.
2. A 25% bonus with a 24 weeks lock-up.
3. A 50% bonus with a 52 weeks lock-up.

Multi Blockchain Airdrop Formula

Each blockchain will have its own SATURN tokens to govern their own DAO, these tokens would be airdropped via the following formula.

- 50%** SATURN tokens on a new blockchain, such as SATURN Classic on Ethereum Classic blockchain, will be distributed among SATURN ICO participants & strategic investors.
- 50%** SATURN tokens on a new blockchain will be distributed among holders of SATURN on Ethereum blockchain at a predefined snapshot date, much like a hard fork.

Token Allocation:

Saturn Network Achievements:

Saturn Network is the team behind the [ERC20 to ERC223 upgrade protocol](#) and is innovating the way ICO investment works with the use of a [dApp](#). A forward-thinking group of individuals that keeps transparency at the heart of their vision: which is why we run [Rados](#) a blog that follows us every step of the way.

We don't believe in just talking or using buzzwords, which is why we already operate an accessible proof of concept: [Radex](#). A zero fees decentralized exchange for trading Ethereum tokens, which will be the first exchange to adopt the Saturn Protocol.
